

# DECENTRALISED WATER AND ENERGY RECYCLING IN BUILDINGS: A CORNERSTONE FOR WATER, ENERGY AND CO<sub>2</sub> EMISSIONS REDUCTION

**Speaker:** Erwin Nolde, Berlin  
mail@nolde-partner.de

**Water Efficiency Conference 2014**  
**Brighton, UK**

# Water and Energy Recycling (1960)

very resource efficient,  
but it could be a bit  
more comfortable!

## 1. Energy production is a high water consuming process

**Water demand of cooling tower<sup>1</sup> for the production of 1 kWh<sub>elec.</sub> from**

- oil/gas: 2.6 litres of water/kWh
- nuclear reactor: 3.2 litres of water/kWh

■ **CO<sub>2</sub> Production<sup>2</sup>:**

Average Germany: 0.6 kg CO<sub>2</sub>/kWh<sub>elec.</sub>

- **Decreasing primary energy factor:**  
from 3.0 to 2.7, 2.6 and 2.4 (2014)  
to 1.8 kWh<sub>prim.</sub>/ kWh<sub>elec.</sub> (2016)

<sup>1</sup> [http://www.energieverbraucher.de/de/Umwelt-Politik/Umwelt-und-Klima/site\\_894/](http://www.energieverbraucher.de/de/Umwelt-Politik/Umwelt-und-Klima/site_894/)

<sup>2</sup> <http://www.co2-emissionen-vergleichen.de/Stromerzeugung/CO2-Vergleich-Stromerzeugung.html#CO2-Vergleich-Stromerzeugung>

## 2. Water treatment and distribution is a high energy consuming process

- **Berlin 2012:**  
Public water supply and wastewater treatment (for 3.5 m people excluding industrial sector) requires as much electrical energy as the household demand of a city with 280,000 inhabitants.

[http://www.bwb.de/content/language1/html/7198.php\\_8326.php](http://www.bwb.de/content/language1/html/7198.php_8326.php)

**Specific elec. energy demand in Germany:**  
approx. 1 - 3 kWh/m<sup>3</sup> and more.

- Energy demand for only **desalination**: ca. **5 kWh/m<sup>3</sup>**  
(depending on salt concentration)
  - excluding water and wastewater transport and treatment and environmental impacts
  - produce three times more wastewater and CO<sub>2</sub>

<http://www.pca-gmbh.com/appli/desal.htm>

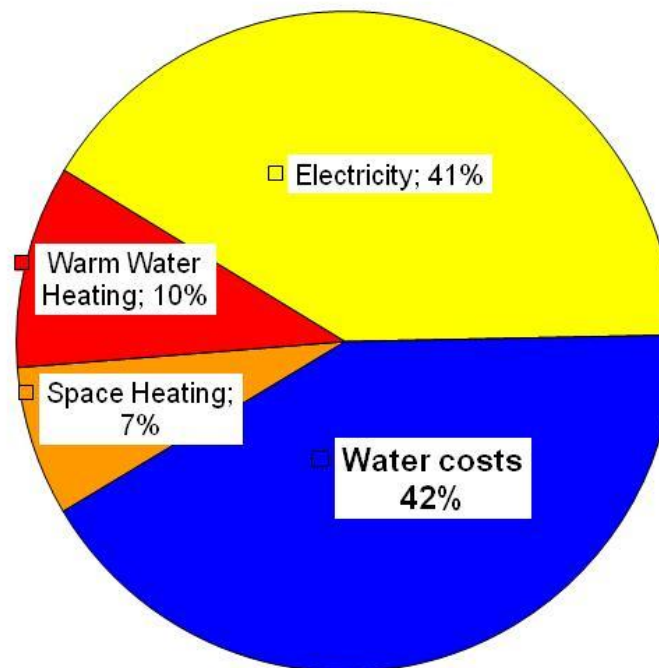

## Requirements for water and energy recycling

- no hygienic risk for users
- no loss of comfort
- environmentally friendly
- low maintenance technology
- cost efficient

## Energy and water costs in a passive house (123 persons and 41 dwellings covering an area of 4,600 m<sup>2</sup>)

### Saving potential:

approx. 200 kWh//P/a  
= 1,700 €/a

approx. 60 L/P/d  
= 13,000 €/a

	specific demand	yearly demand	unit	price	yearly costs
Space Heating	15 kWh/m <sup>2</sup> /a	69.000	kWh/a	0,07 € /kWh (Gas)	4.830,00 €
Warm Water Heating	760 kWh/P/a	93.480	kWh/a	0,07 € /kWh (Gas)	6.543,60 €
Electricity	875 kWh/P/a	107.625	kWh/a	0,25 € /kWh	26.906,25 €
Water	122 L/P/d	5.477	m <sup>3</sup> /a	5,00 € /m <sup>3</sup>	27.385,95 €
				total	65.665,80 €

# Greywater recycling with heat recovery<sup>©</sup>

First passive house in Berlin for 123 tenants with 41 dwellings and 4 trade units

## Quality guidelines and service water quality

Microbiological parameters in accordance with the EU Guidelines for Bathing Waters (76/160/EWG)\*:

<b>Total coliforms:</b>	<b>&lt; 100/ml</b>	<b>Range:</b>	<b>0.1 - 1/ml</b>
<b>E. coli:</b>	<b>&lt; 10/ml</b>		<b>0.03 - 0.3/ml</b>
<b>P. aeruginosa:</b>	<b>&lt; 1/ml</b>		<b>0.2 - 0.7/ml</b>

Physical and chemical parameters according to Berlin guidelines\*\*:

<b>BOD<sub>7</sub>:</b>	<b>&lt; 5 mg/l</b>	<b>Range:</b>	<b>&lt; 3 - 5 mg/l</b>
<b>O<sub>2</sub>-Saturation:</b>	<b>&gt; 50%</b>		<b>60 - 90%</b>
<b>UV-Transmission<sub>254 nm</sub>:</b>	<b>&gt; 60%</b>		<b>70 - 75% (local drinking water: 80%)</b>
		<b>Turbidity:</b>	<b>0.5 - 1.5 NTU</b>

Not a single German centralised WWTP is producing such a high quality!

\*<http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2006:064:0037:0051:EN:PDF>

\*\*[http://www.stadtentwicklung.berlin.de/internationales\\_eu/stadtplanung/download/betriebswasser\\_englisch\\_2007.pdf](http://www.stadtentwicklung.berlin.de/internationales_eu/stadtplanung/download/betriebswasser_englisch_2007.pdf)

## Water and energy input and output (Monthly median values for 2013)

## Results ( March 2013 )

### Drinking water temperatures 8 C; Average heat recovery 15.5 kWh/m<sup>3</sup>

## Greywater recycling with integrated heat recovery (Arnimplatz)

Heat recovery from greywater substitutes about 35 m<sup>2</sup> of thermal solar panels.

Yearly electricity demand can be covered by 17m<sup>2</sup> PV.

### Space requirement (prototype):

9 m<sup>2</sup> = 0.1 m<sup>2</sup>/Person  
(equi. to A4 paper size)

### Investment costs (prototype):

additional costs: 11.30 €/m<sup>2</sup>  
of living space (825 €/P)  
including assembly and **19% VAT**

### Water savings:

5,000 €/a  
approx. 1,100 m<sup>3</sup>/a of high quality  
service water are made available

### Heat recovery from greywater:

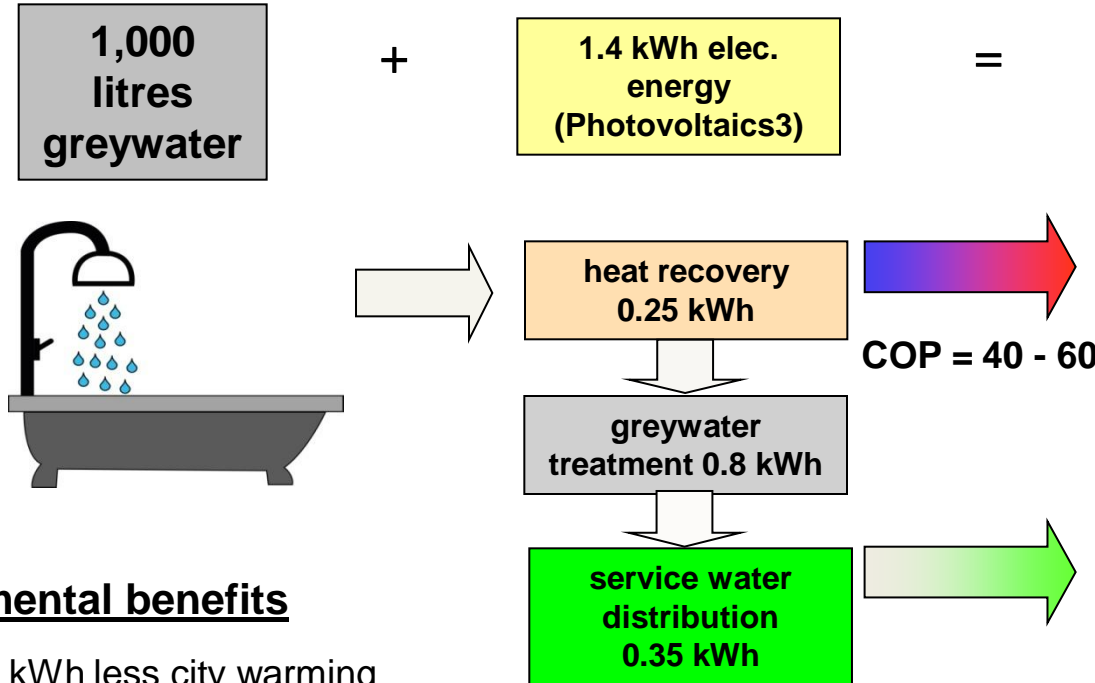

approx. 13,000 kWh/a (1,000 €/a)

### Maintenance and operation:

- Electricity requirement:  
approx. 1,700 kWh/a (500 €/a);
- very little maintenance following  
12 months of operation.

# Greywater Recycling with Heat Recovery

## Individual Benefits

+ 1,000 litres of high quality service water for toilet flushing, laundry, etc.

+ Credit points in building certification (BREEAM, LEED, DGNB, etc.)

## Environmental benefits

- (1) 10 – 15 kWh less city warming
- (2) 1,000 litres of groundwater saved
- (3) 1 - 3 kWh saved from drinking water and wastewater treatment including pumping
- (4) saving on chemicals for drinking water and wastewater treatment
- (5) less concrete corrosion in sewer
- (6) CO<sub>2</sub> reduction (0.251 kg CO<sub>2</sub> per kWh recycled thermal energy plus 0.6 kg CO<sub>2</sub> per kWh saved electric energy for water service).

## Conclusions

1. Recycled greywater safely fulfils all quality requirements. The pilot plant is running since more than two years with permanently good results and nearly maintenance-free .
2. Water and energy recycling is most resource efficient on site, where wastewater can be collected and recycled in the building. Upstream heat recovery (COP 40 - 60) is more than 10 times resource-efficient than with conventional centralised systems, where thermal energy is lost in the sewer before reaching the heat pump (COP 3 - 4).
3. Individual planning and dimensioning of the plant is indispensable.
4. With the presented prototype, payback periods of less than 10 years can be achieved with customised planning and design. Qualified plant monitoring is being currently used to increase the efficiency of the system.
5. Decentralised water and heat recovery should become an essential component for all new buildings because it acts as **a cornerstone for water, energy and CO<sub>2</sub> emissions reduction.**

# Thank you for your attention.

„Es ist nicht genug, zu wissen,  
man muss auch anwenden;  
es ist nicht genug, zu wollen,  
man muss auch tun.“

Johann Wolfgang von Goethe (1749 – 1832)  
(Werk: Wilhelm Meisters Wanderjahre)
