

Towards Improved Water and Energy Efficiency in Urban Water Systems

Prof. Zoran Kapelan
University of Exeter, UK

WATEF Conference, Exeter, 7 Aug 2015

Overview

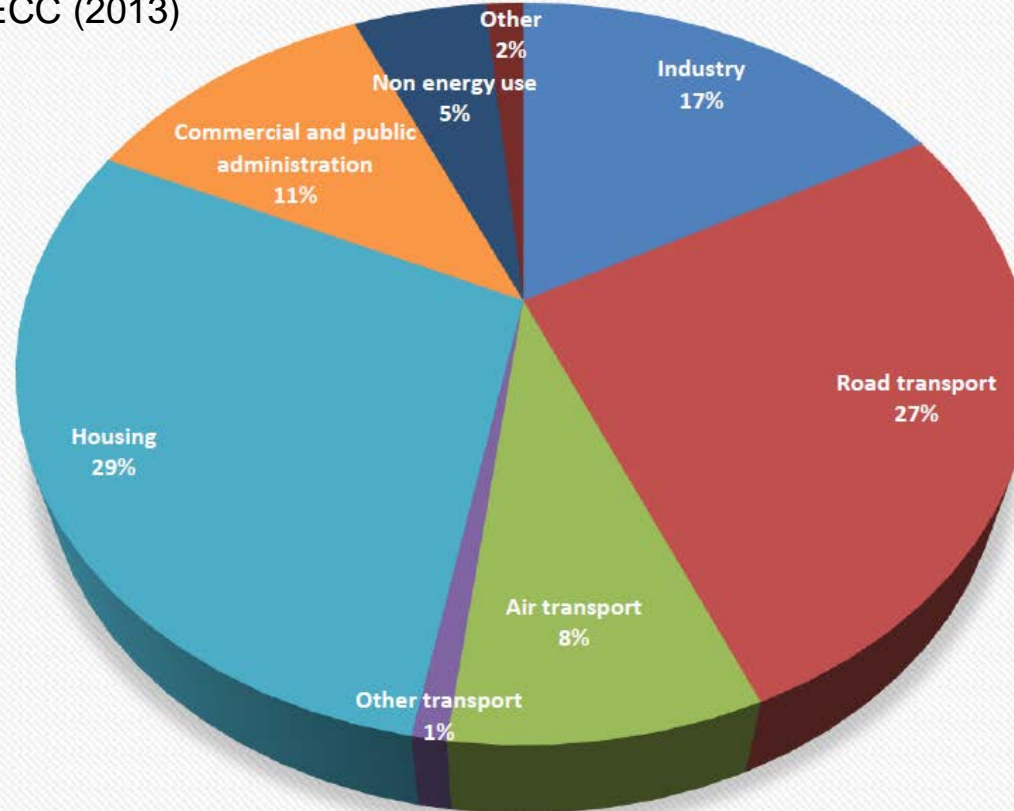

- Water-energy nexus
- EU TRUST project
- The metabolism concept
- WaterMet² methodology and tool
- Example applications
- Summary
- Ongoing/future work

The Water-Energy Nexus

UK Energy Profile

Source: DECC (2013)

Total = 1,724 TWh (2012)

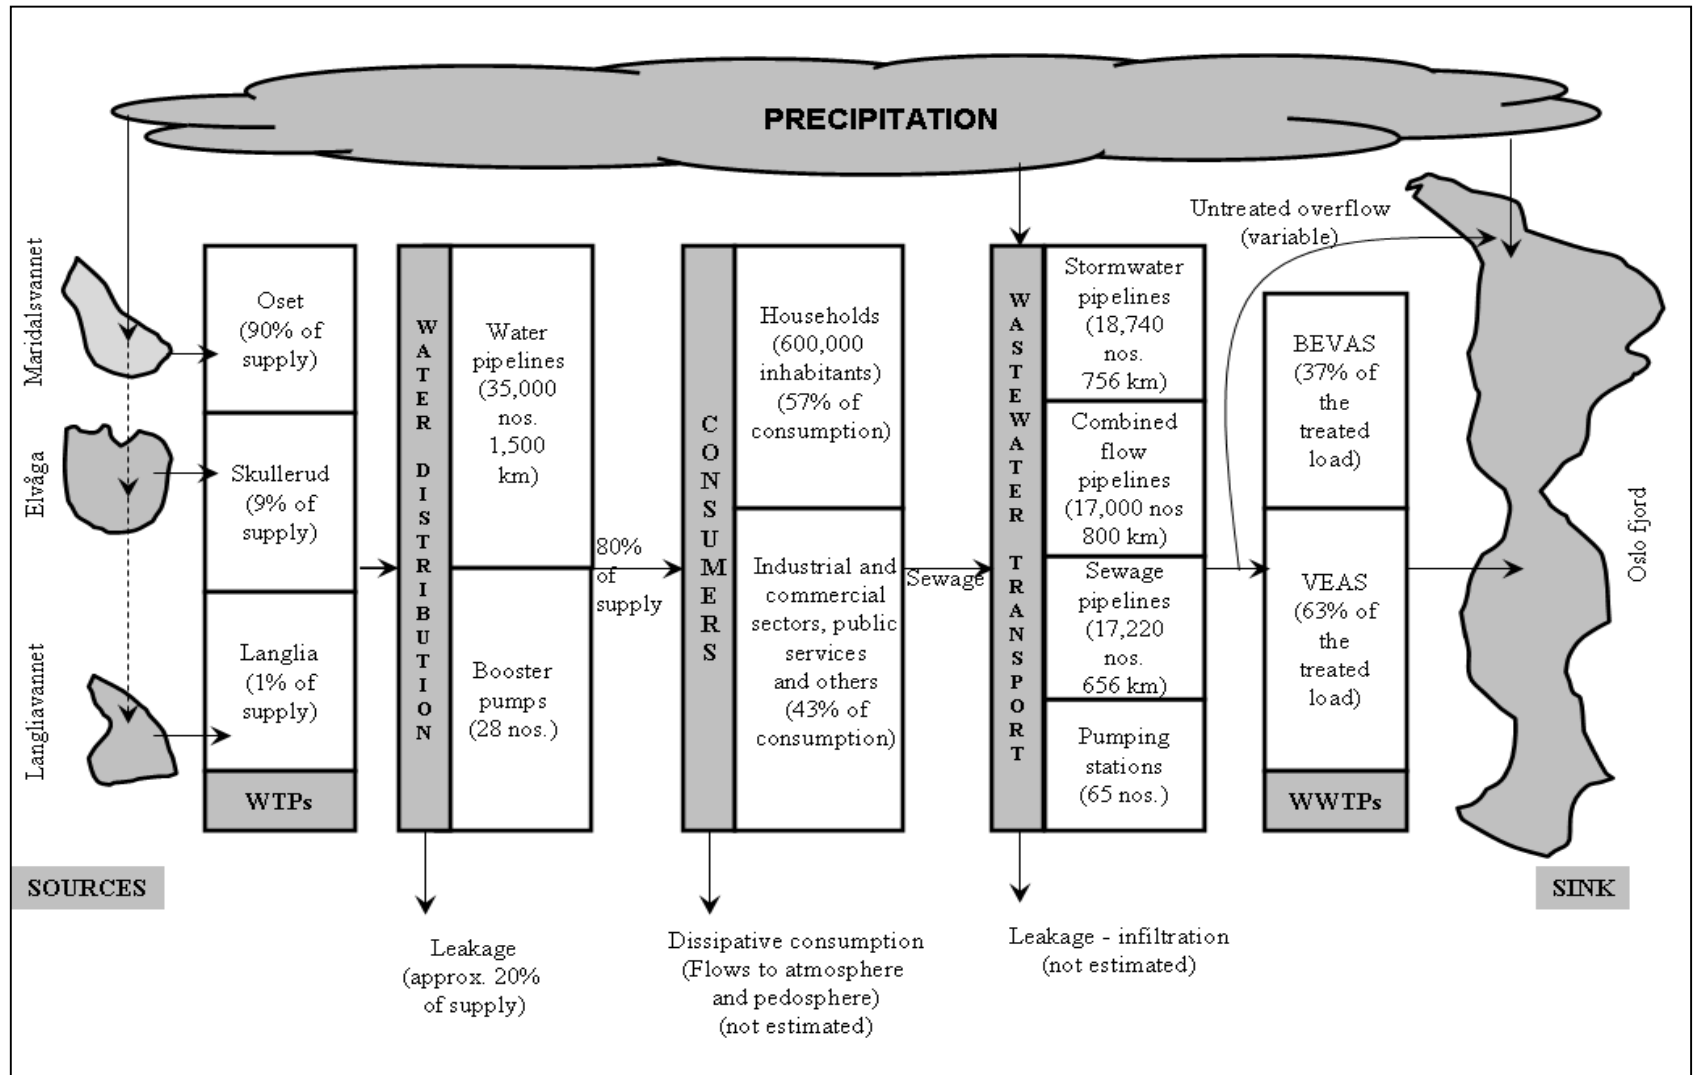

EU TRUST Project

- TRansition to Urban water Services of Tomorrow
- 30 partners led by IWW in Germany
- 2011-2015, 7M Euros
- Wide range of issues
- UoE led 3 WPs
- www.trust-i.net

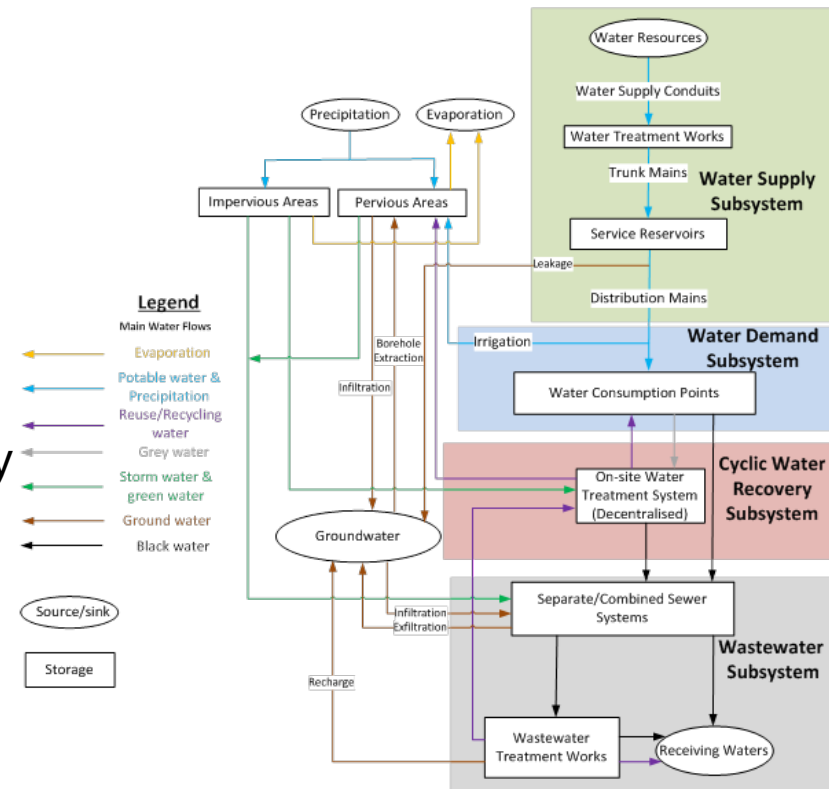

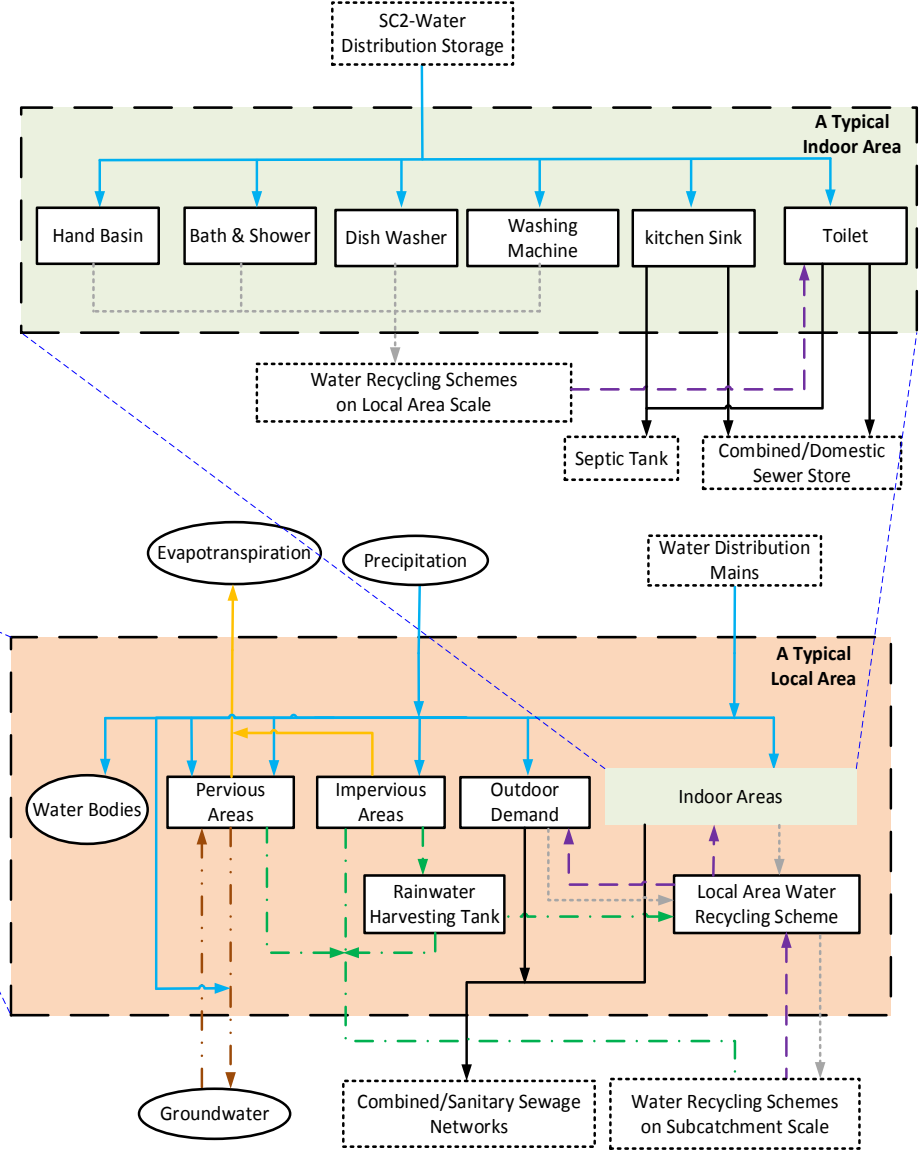

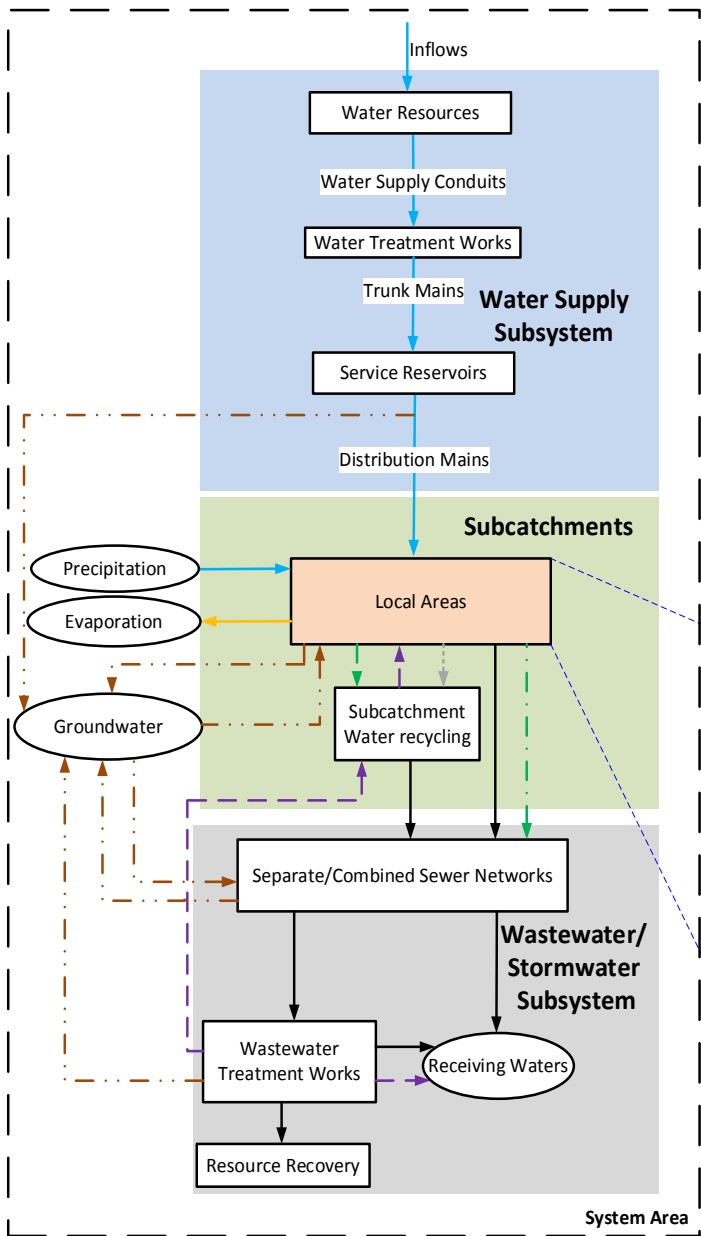

UWS Metabolism

WaterMet²

- Conceptual model based on water mass conservation
- Evaluates UWS metabolism by quantifying water, energy/GHG emissions, materials, chemicals, pollution and other fluxes
- Covers the full urban water cycle in a generic UWS
- Simulates both water quantity and quality UWS performance
- Focus on sustainability issues
- Daily time step used in a multi-year simulation
- Key UWS elements and processes represented using 4 different spatial scales

UWS Components and Processes

UWS Component	Description	Spatial Scale in WaterMet ²			
		System Area	Subcatchment area	Local area	Indoor area
Water supply conduits (SC)	Conveyance of raw water from water resources to WTWs	X			
Trunk mains (TM)	Conveyance of potable water from WTWs to service reservoirs	X			
Distribution mains (DM)	Distribution of potable water from service reservoirs among water consumption points	X			
Combined/separate sewer networks (SN)	Collection of sanitary sewage/ stormwater runoff and conveyance to WWTWs/receiving waters	X			
WTWs, WWTWs	Treatment of raw water and wastewater	X			
Service reservoirs (SR)	Potable water storage prior to distributing among the costumers	X			
Water resources (WR)	Raw water storage				
Grey water recycling tank	Collection and treatment of grey water from water consumption points for water reuse		X	X	
Rainwater harvesting tank	Collection and treatment of rainwater from impervious areas for water reuse		X	X	
Rainfall-runoff modelling	Conversion of precipitation to surface runoff based on hydrologic specifications			X	
Water consumption points	Indoor and outdoor water usages			X	X

WaterMet² Data Requirements

- Application dependant
- Data hungry:
 - UWS definition (principal layout, key components, etc.)
 - Energy related
 - Quality related
 - Many other
- Raises substantially with increased spatial resolution

Application #1: Oslo, Norway

Description

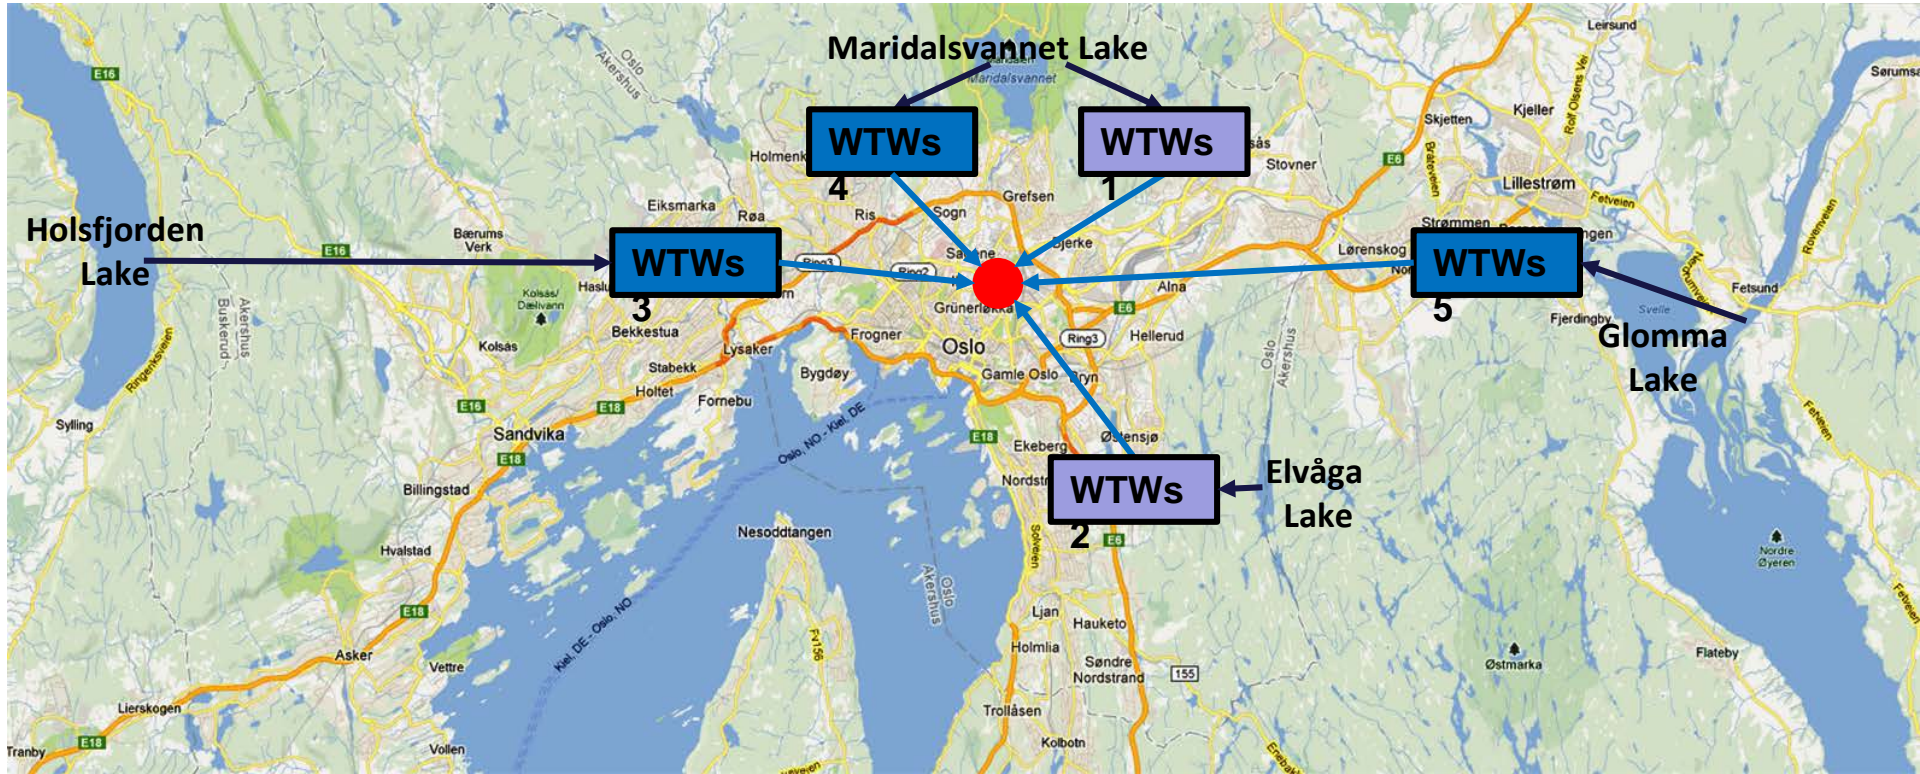

- Two main existing sources / WTWs (90% and 10%)
- Two existing WWTWs (63% and 27%)
- Population of 607K in 2011, expected to increase to 1.15M in 2041
- Ageing system with leakage and other issues
- ‘Lumped’ WaterMet² model created and used to evaluate different intervention strategies over 30 years (2011-2040) assuming high population growth scenario
- WaterMet² model calibrated manually using historical data

WaterMet² Model Calibration

Water Sources

existing water supply sources

Intervention Strategies

Strategy#1

• Business as usual (BAU) strategy

Strategy#2

Addition of Holsfjorden Lake water source plus WTW3 and WTW4, all from 2020

Strategy#3

1% increase in the rate of annual pipeline rehabilitation starting from 2015

Strategy#4

0.5% increase in the rate of annual pipeline rehabilitation plus 10% additional annual water meter installation starting from 2015

Strategy#5

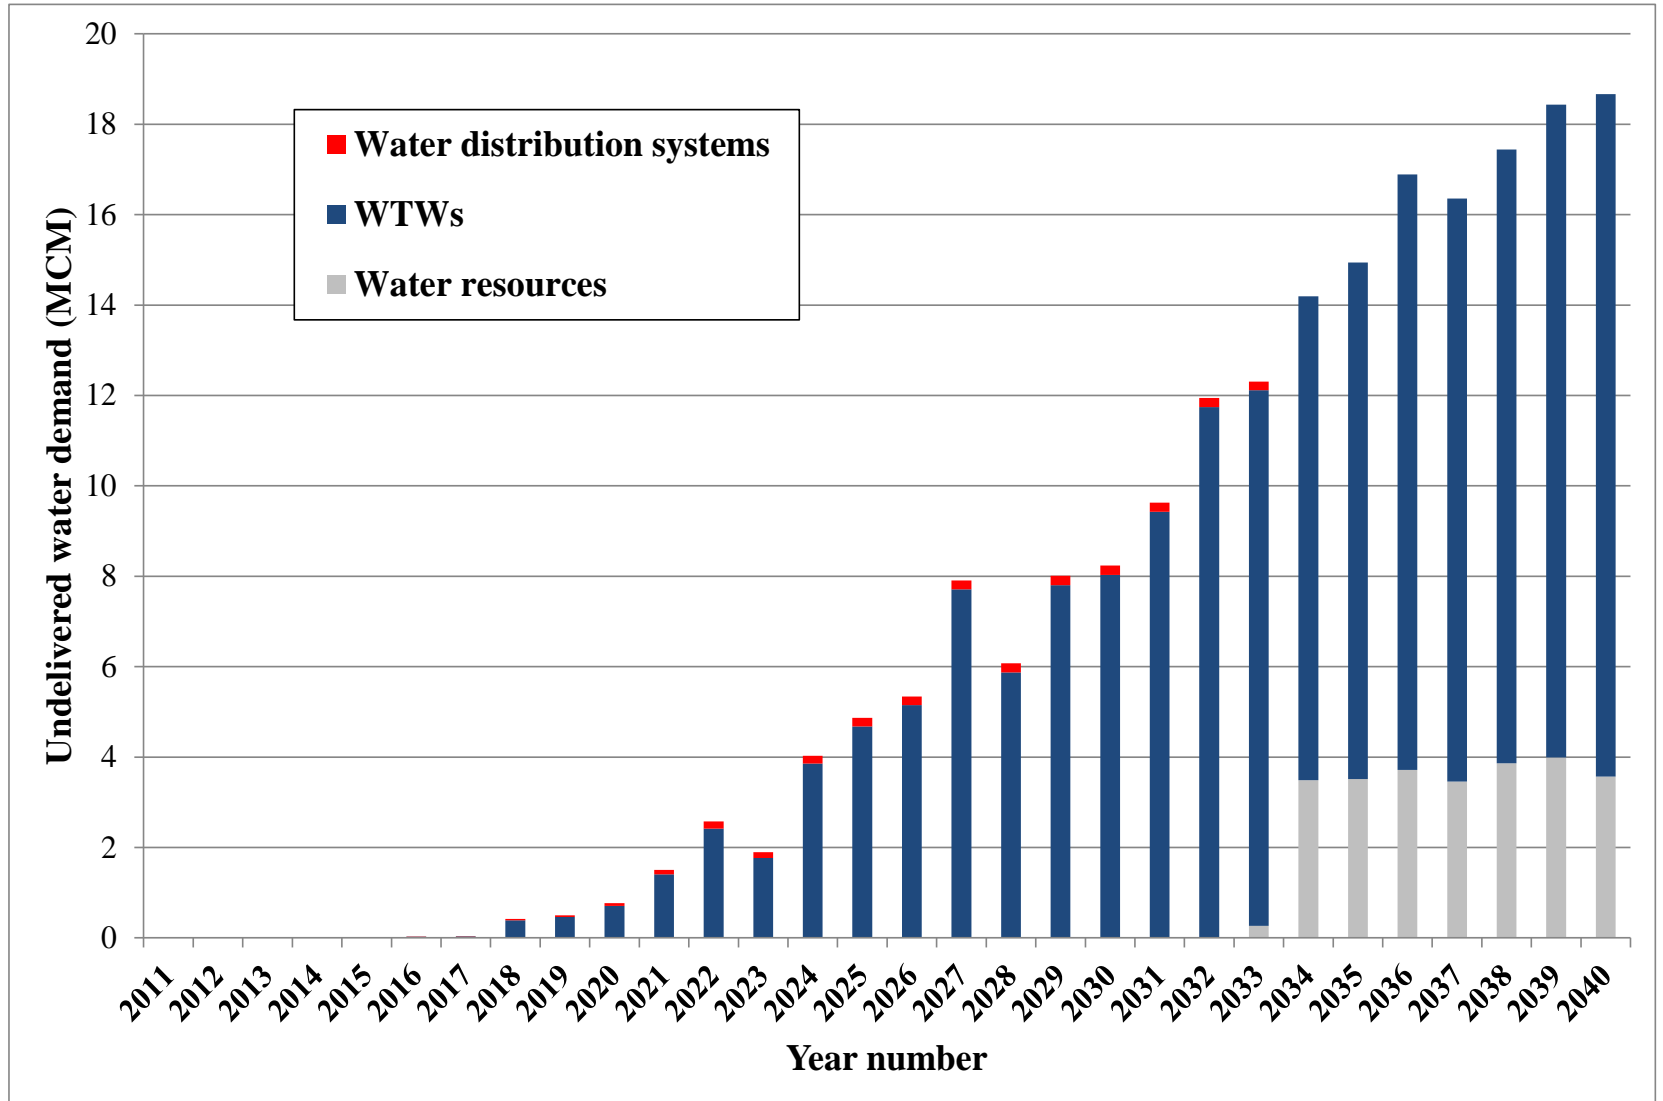

Large scale addition of RWH and GWR systems

Evaluation Criteria

- Present value of total capital costs (WaterMet²)
- Present value of total O&M costs (WaterMet²)
- Reliability of water supply (WaterMet²)
- Total water leakage (WaterMet²)
- Total GHG emissions (energy) (WaterMet²)
- Total volume of annual CSOs (WaterMet²)
- Social acceptance of demand management schemes (quantified by expert judgement)

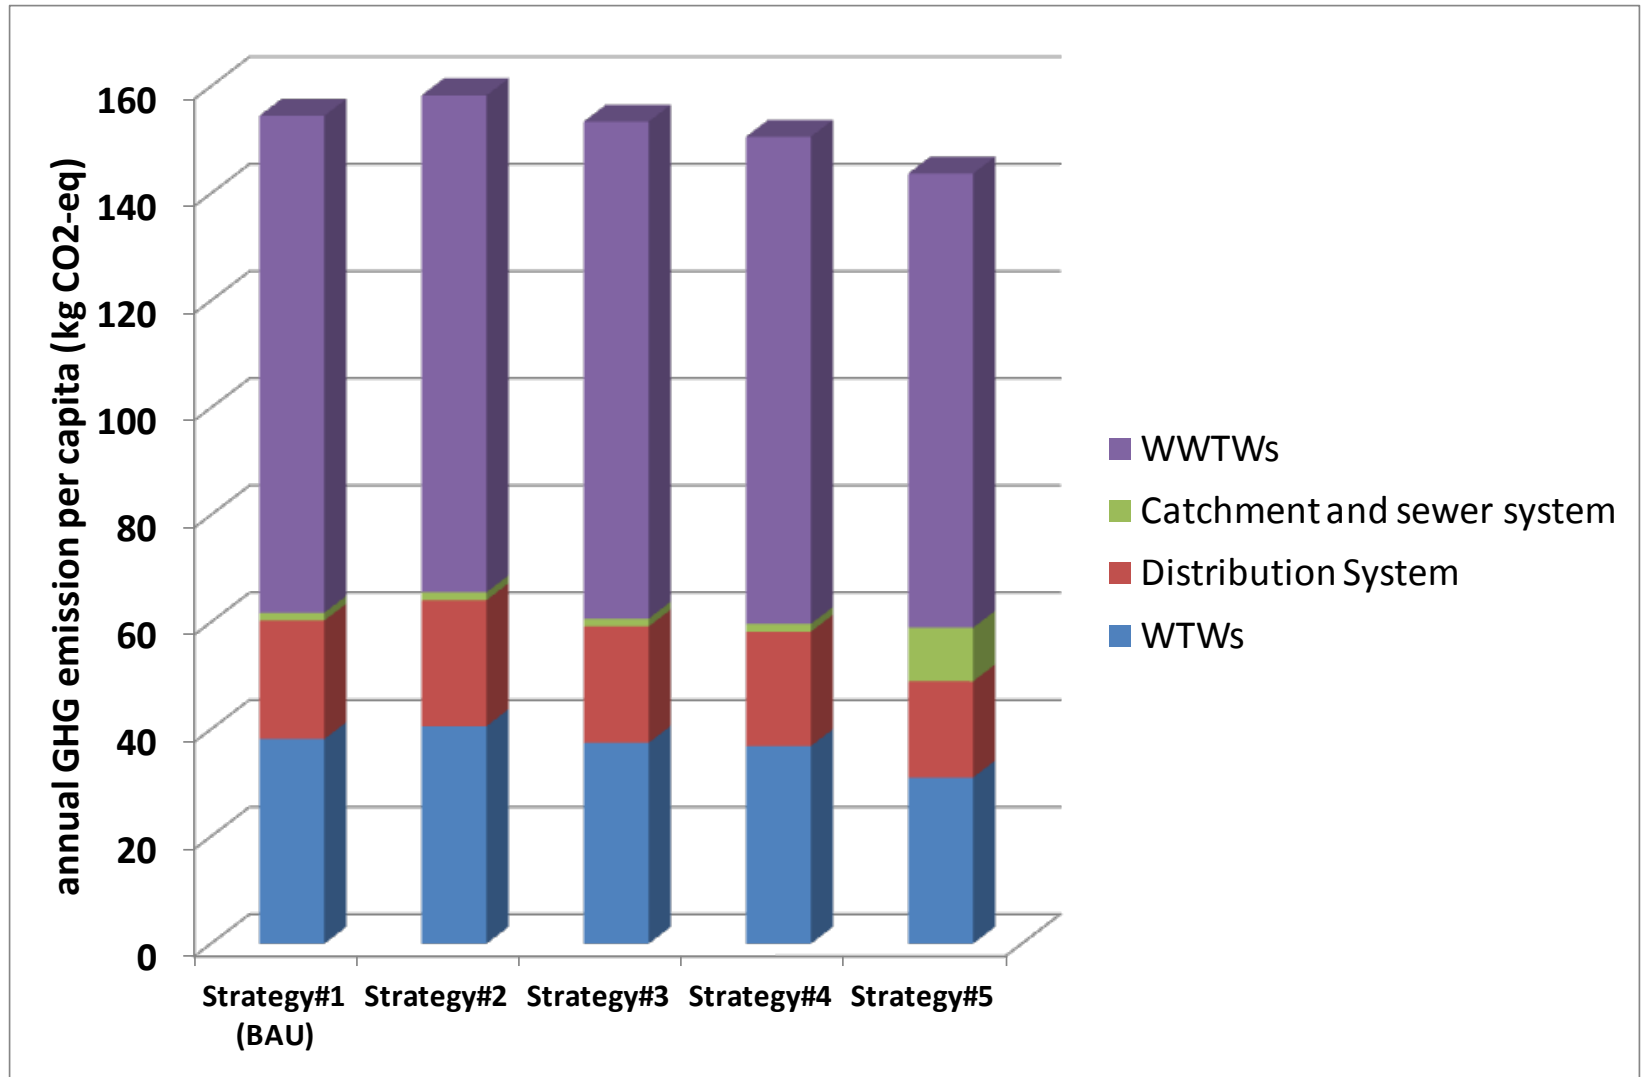

Results: Undelivered Water (BAU)

Total GHG Emissions (Energy)

Total GHG Emissions (Energy)

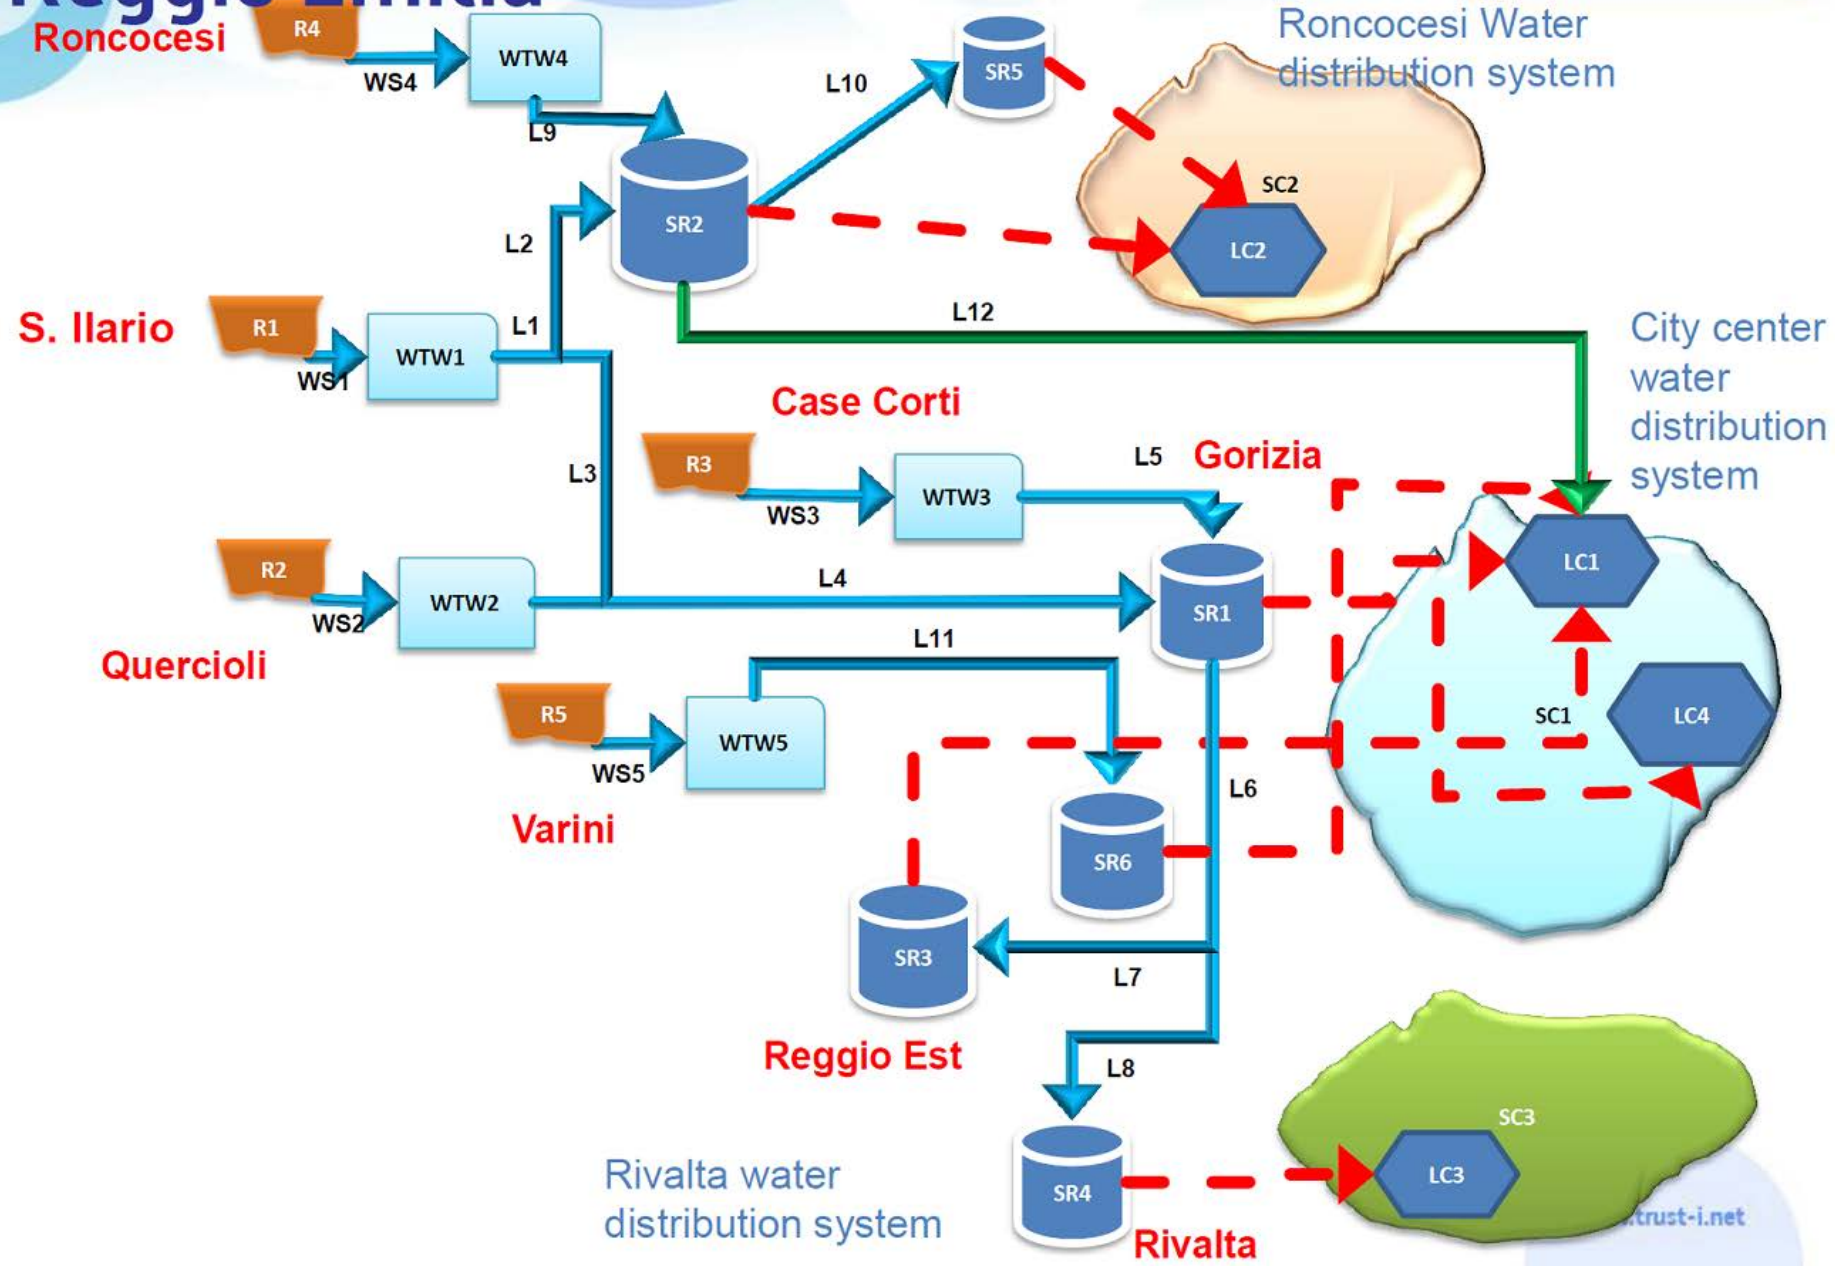

Trade-offs

	<i>Capital cost</i>	<i>O&M Cost</i>	<i>Reliability</i>	<i>Leakage</i>	<i>GHG emissions</i>	<i>CSO volume</i>	<i>Public acceptance</i>
	Million Euro	Million Euro/year	%	MCM/year	kTons/year	MCM/year	-
Strategy #1 (business as usual)	0	55	94	24	95	35	7
Strategy #2 (additional WTW)	401	87	100	25	99	35	5
Strategy #3 (1% additional annual rehabilitation)	265	58	97	19	95	35	6
Strategy #4 (0.5% additional annual rehabilitation & 10% additional annual water meter installation)	264	58	98	21	93	33	4
Strategy #5 (RWH and GWR systems)	278	67	99	19	89	24	2

Application #2:
Reggio Emilia,
Italy

Water supply system of the City of Reggio Emilia

Reggio Emilia

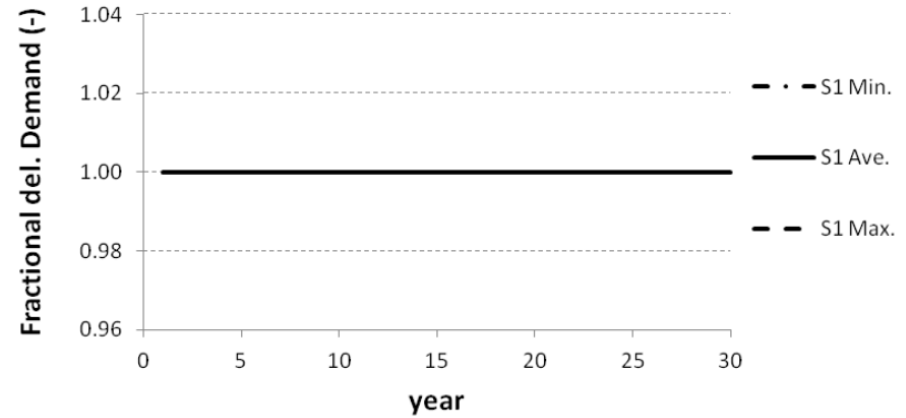

- Two intervention strategies considered:
 - Business as usual
 - New pipeline, located in the northern part of the system which connects an existing water source (R4, via SR2) to the city centre
- Under the following scenarios:
 - Low population increase
 - Medium population increase
 - High population increase

Results: Strategy 1

Total Water Demand

Fractional Water Demand Delivered

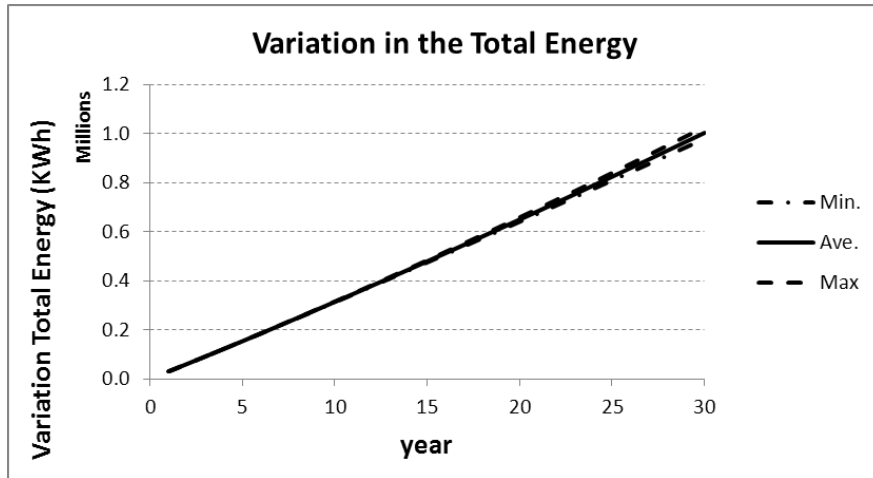

Total Energy

Total GHG Emission

Difference in Strategies 1 and 2

Year	Total Energy Used (KWh)	GHG emissions (Ton CO2-eq)	Total operational cost (€)
1	30,180	6.3	1,512
10	346,598	72.8	17,369
20	649,582	136.4	32,552
30	1,002,976	210.6	50,261

Summary

- WaterMet² model/tool developed based on the UWS metabolism principles
- The applications demonstrate how the metabolism-based concept combined with integrated modelling can be used to assist planning future UWS at the strategic level by identifying complex trade-off under different scenarios

Ongoing/Future Work

- Further validation and demonstration:
 - Two towns in the Galapagos Islands
 - Kerman City, Iran
 - Girona, Spain
- Further development:
 - Additional energy fluxes
 - Expansion to W-E-Food nexus
 - Other
